

## ABSTRACT OF THE DISCLOSURE

An electronic component includes at least one piezoelectric vibrating portion, a connecting portion provided on a substrate, a structural piece including a concavity so as not to disturb the vibration of the piezoelectric vibrating portion, and a connecting wiring for electrically connecting a pad on the substrate to a mounting wiring disposed on the upper surface of the structural piece. The structural piece further includes a through hole having an electroconductive material filled therein. The structural piece seals the piezoelectric vibrating portion.
